Abstract

We describe the background and rationale of an internet campaign to raise awareness of language learning impairments (RALLI).

Keywords

Awareness, internet, specific language impairment

In contrast to dyslexia and autism, specific language impairment (SLI) is a neglected condition not only in research, but also in debates about policy and practice (Bishop, 2009; Conti-Ramsden, 2009). A recent analysis of research publications and grants confirmed this impression, showing

that SLI attracted far less research funding and led to fewer publications than many other conditions of comparable frequency and severity (Bishop, 2010). Perhaps the most striking comparison was with attention deficit hyperactivity disorder (ADHD), which is of similar prevalence to SLI and was rated by clinicians as comparable in severity of impact. Between 1985 and 2009, there were 1,140 publications on SLI in Web of Science, compared to 12,631 on ADHD. Between 2008 and 2009, funding was 19 times greater for ADHD than for SLI. It is fascinating to speculate on reasons for this neglect: one possibility is that the professional discipline associated with a disorder plays a role, so that conditions that are seen as the domain of medics receive more attention and better funding than those that are the focus of non-medical disciplines such as speech and language therapy. Furthermore, SLI is a hidden disability and most individuals with SLI can talk, and their difficulties are not always obvious. Another factor may be the extent to which parent groups lobby for recognition and funds. This has been particularly striking in the case of autism, where parents have not only contributed substantial resources to autism research, but have also lobbied governments very effectively (Silverman and Brosco, 2007). This has simply not happened to the same extent in the case of SLI. The fact that SLI is a familial condition means that some parents may themselves have language or literacy problems, and could find it daunting to challenge existing political, educational and financial structures.

Having identified the problem, the question was what to do about it. At the end of 2011, we decided to take action and formed a group with the name RALLI, standing for 'raising awareness of language learning impairments'. Our group consists of four academics, two of whom trained as speech and language therapists and two as clinical psychologists, together with a practising speech and language therapist. We decided that what was needed was a campaign to put accessible materials on the internet in a form that would attract attention from the general public. Our aim was not to raise money or to improve provision, but simply to improve the recognition of children's language impairments: we felt that this aim had to succeed before we could move on to more ambitious goals.

We benefited enormously from financial support from the charities AfasicCymru and the Waterloo Foundation, and from agreement of one of our funders, the Economic and Social Research Council, to commit funds to our project as part of research dissemination. Other charities and research groups with allied interests have been enthusiastic about our vision and have provided invaluable support via our advisory board. We received invaluable guidance from a public relations company, Teamspirit, who contributed pro bono advice and expertise to get the campaign up and running. It was quite an adventure for the group of us to undertake this challenge, which was unlike anything we had ever done before. We were all used to working hard with attention to detail, but had no experience of marketing our ideas; however, this was, as we gradually realized, what we needed to do. In effect, we needed an advertising campaign to promote the idea of specific language impairment. This meant discarding some of our traditional notions about how to communicate. Scientific talks, bristling with PowerPoint presentations and sessions lasting 30 or more minutes, were not going to be effective. We needed to facilitate the voices of young people and families affected by specific language impairment, have them take centre stage and tell their stories, so that people could relate to what they were hearing. We felt it was important, however, that we also provided information that was evidence based, and that posed a challenge of how best to convey research results accurately and succinctly, without getting bogged down in detail.

In May 2012 we launched a YouTube channel (www.youtube.com/rallicampaign) in order to reach three target audiences: families of children who may have SLI, professionals working with children – particularly in education – and young people with SLI themselves. As well as learning more about how to go about promoting our ideas, we have all been thrust into the deep end and had

to learn a great many new technical and creative skills, especially Becky Clark, our editor. Most of our budget goes on creating professional-quality short films, and we aim to release at least one of these every month, covering topics such as what it is like to be a parent of a child with SLI, what indications of language problems teachers can look out for, and how language problems may be missed if a child has reading difficulties. We know that our budget will not go far, however, so we have also been making short videos ourselves using a handheld digital video camera. It is challenging to cover a topic such as 'What causes SLI?' in just three minutes, but we realize that the important issue is to get across a simple message. We can then follow this message up by linking the video with a more in-depth slide presentation and reference list, so that the evidence is there for those who want more detail.

One issue that we have had to confront is the terminological confusion that surrounds children's language impairments. There is growing evidence that, on the one hand, children who meet criteria for SLI can be very varied, and there are thorny questions about overlaps with autism and other developmental disorders. Another vexed question is the inclusion of nonverbal ability in the diagnostic criteria for SLI. In the past, it was usual to require a large discrepancy between verbal and nonverbal ability, but this does not seem to be very meaningful: it does not define an aetiologically distinct group (Bishop, 2004), does not necessarily map on to actual clinical populations (Stark and Tallal, 1981), and does not predict response to intervention (Bowyer-Crane et al., 2011). We decided to focus first on those children whose nonverbal ability is in the normal range, but not necessarily substantially higher than verbal ability. We are also, initially at least, presenting a clear picture of SLI without explaining the likelihood of comorbidity with other developmental difficulties. Once we have established that these children do exist and need to have their voices heard, we will be ready to cover further diagnostic and terminological issues that inevitably arise in this field.

It has been amazing to see the results of harnessing the power of the internet, both on the speed of dissemination and on the breadth of audience; this is mirrored by the YouTube channel's global viewing statistics. One unexpected outcome has been the enthusiastic reception by an international audience, which has helped us create versions of our introductory 'What is SLI?' video in a range of languages, including German, French, Spanish, Portuguese and Chinese. There is, however, still a long way to go, and we urge readers of *Child Language Teaching and Therapy* to look at our channel, subscribe, add your comments and forward the link to parents, fellow professionals and friends. We are also keen to be responsive and hear what else you as viewers may want to see covered in the work of RALLI. You may even wish to create your own films that we can link to from our channel. As professionals working with young people with language impairment, we feel a responsibility to change the current neglect of this condition and we would welcome your involvement to help us to spread the word.

Funding

RALLI has been launched with funding support from Afasic, Afasic Cymru, The Waterloo Foundation and the Economic and Social Research Council (ESRC).
